```
================================================================================
Version 0.95                                                          2020-01-17
================================================================================
```
* Fixed a DMX reception issue.

```
================================================================================
Version 0.94                                                          2018-03-07
================================================================================
```
* Fixed voltage maximum for US variant.

```
================================================================================
Version 0.93                                                          2017-11-07
================================================================================
```
* Added support for US variant.
* Hardware variant is checked upon startup.
* Improved behaviour in the case of a 0V setpoint value.
* RDM identify now causes the the screen to appear inverted and non inverted
  intermittently but otherwise, the content of the display no longer changes
  when the device is being identified via RDM. User interaction (pushing a
  button or turning the encoder wheel) will disable the periodic inversion of
  the display.

```
================================================================================
Version 0.92                                                          2017-07-13
================================================================================
```
* Changed the switching frequency to 23 kHz.
* Small fixes in the UI.

```
================================================================================
Version 0.91                                                          2017-05-31
================================================================================
```
* First release.
